

📱 FLUTTER UI ESSENTIALS

Creating a Simple Mobile Screen

Learn how to build responsive mobile user interfaces using Flutter's core layout and content widgets.

Container

Column

Row

Text

Image

Button

Core Flutter UI Widgets

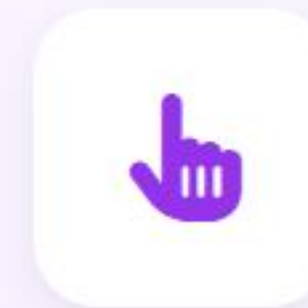

Layout & Structure

Column, **Row**, and **Container** arrange elements vertically, horizontally, and control spacing with padding and background styling.

Visual Content

Text displays styled typography while **Image** presents graphical assets or network photos to deliver rich visual information.

User Interaction

Buttons like **ElevatedButton** and **TextButton** capture user touch events to trigger actions and navigate through app workflows.

Layout & Structure Widgets

Column & Row Widgets

The primary building blocks for multi-child directional layouts:

Column Arranges children vertically top-to-bottom.

Row Arranges children horizontally left-to-right.

Key properties: `mainAxisAlignment` and `crossAxisAlignment` control positioning along primary and perpendicular axes.

Container Widget

A versatile single-child styling box for customization:

Dimensions Explicit width and height constraints.

Spacing External margin and internal padding.

Decoration Custom background colors, rounded borders, and subtle drop shadows.

Content & Interactive Elements

 **Text Widget:** Displays user interface text. Customize typography using `TextStyle` to set font size, font weight, letter spacing, and colors.

 **Image Widget:** Renders visual assets using `Image.asset()` for local files or `Image.network()` for online photos with `BoxFit` attributes.

 **Button Widgets:** Use `ElevatedButton` for filled action triggers or `TextButton` for secondary actions, configured with the `onPressed` callback.

 **Widget Tree Composition:** Nest these elements together seamlessly inside scaffold bodies to create intuitive, highly responsive mobile screens.

Assembling the Mobile Screen

By nesting our basic widgets into a logical hierarchy, we turn simple components into a complete mobile user screen.

```
Column(  
  children: [  
    Image.network('https://...'),  
    Container(  
      padding: EdgeInsets.all(16),  
      child: Text('Welcome to Flutter'),  
    ),  
    ElevatedButton(  
      onPressed: () {},  
      child: Text('Get Started'),  
    ),  
  ],  
)
```

Start Building Your Flutter UI!

You now have all the core widgets needed to design clean,
responsive mobile application screens.
